## Taking measurements correctly = optimal fit

- 1. If possible, always measure both hands
- 2. Please sketch both hands (provides us with the original shape of the disabled hand)
- 3. If possible, always sketch the hand straight with the middle finger forming a straight line with the forearm
- 4. Do not spread the fingers too widely apart

- 1. If the finger(s) are severely bent,
- 2. please roll up a thin piece of cardboard,
- 3. place it in the palm,
- 4. draw the outline on it and
- 5. measure the finger length.

- 1. If there is a protrusion on the back of the hand,
- 2. please position the hand upright on its side,
- 3. draw around the hand on its side and
- 4. measure the protrusion and plot its location.
- 5. Please still draw the outline of the hand laid flat on the paper.
- For major deformities, please attach pictures.
- If possible, fabrication of a plaster model in neutral position.
- Outline drawing

TIP: Gloves that already fit are highly suitable as patterns, please enclose them.

Please fill out both sides of the datasheet!
